

Business Requirements Document (BRD) - Digital Banking Application

Version: 1.0
Role: Business Analyst (Entry Level)

1. Executive Summary

This document outlines the functional requirements for a Digital Banking Application designed to provide customers with a secure platform for account management, fund transfers, and bill payments. The focus is on ensuring data integrity and a seamless user experience during financial transactions.

2. Business Scenario

The application serves as a bridge between the bank's core systems and the end customer. It must handle secure authentication, real-time balance inquiries, and conditional transaction processing based on fund availability.

3. Functional Requirements

ID	Requirement Description	Priority
FR-01	User Authentication: The system must verify user passwords. If credentials are incorrect, an error message must be displayed.	Critical
FR-02	Balance Inquiry: The system shall retrieve real-time account data from the bank's server for balance viewing.	High
FR-03	Fund Validation: For transfers and payments, the system must verify if	Critical

ID	Requirement Description	Priority
	sufficient funds are available before proceeding.	
FR-04	Payment Source Selection: Users shall be able to choose between Checking or Savings accounts for bill payments.	Medium
FR-05	User Onboarding: New profiles must provide options for privacy information and help assistance.	Medium

4. User Roles (Actors)

- **Customer:** Performs logins, checks balances, and initiates transfers/payments.
- **Bank Core System:** Provides real-time data and processes the final transaction.

5. Process Logic Summary

The application logic follows a strict validation path. No transaction (Transfer or Payment) can be executed without a "Sufficient Funds" confirmation from the bank's real-time database. This prevents overdrafts and ensures data consistency across the banking platform.
